

SECURITY ANALYSIS REPORT

Project: **snippet.py**

Generated: 2026-05-12 15:13:48 UTC

Total Findings	1	Chosen Platform	fly
Critical	0	Confidence	0%
High	0	Estimated Cost	n/a
Medium	0	Low	0

Executive Summary

Nestify identified **1** findings with severity distribution: critical=0, high=0, medium=0, low=0, info=1. Agentic deployment planning evaluated cost, security, and technical fit before platform selection.

Deployment Decision

Selected platform	fly	Actual provider	fly
Live URL	not available	URL provider	fly
Provider alignment	aligned	Provider match	Yes

Decision rationale: Platform selected using deployment fit, security context, and cost model.

Raw Report Summary

This report includes detailed security findings, exact remediation actions, why each change is required, how to implement it, deployment alignment, and recovery guidance for reruns.

Project Overview

Detected stack: framework=**unknown**, runtime=**unknown**

Detailed Findings

INFO #1 - The print statement may potentially leak sensitive information.

Location: snippet.py:1

Recommendation: Use a secure logging mechanism instead of print statements.

What to change: Update snippet.py to remove the unsafe pattern or add the missing control.

How to change it: Use a secure logging mechanism instead of print statements.

Validation: rerun the security scan, then confirm the finding is gone before redeploying.

Deployment Intelligence

Chosen Platform: **fly**

Confidence: **0%**

Reasoning: Platform selected using deployment fit, security context, and cost model.

Failure Analysis & Recovery

Failure Reason: Backend deployment failed on fly: Fly GraphQL error: Field 'nodes' doesn't exist on type 'Allocation'

Nestify Recovery Plan: Verify provider credentials, workspace settings, and runtime configuration.

Fix Recommendations

Step 1: Use a secure logging mechanism instead of print statements.

Location: snippet.py:1

Why: This change reduces attack surface and improves deployment reliability.

How: Edit snippet.py:1, implement the remediation, and re-run security validation and deployment checks.

Code-Level Suggestions

- Use a secure logging mechanism instead of print statements. (snippet.py:1)

Why: Use a secure logging mechanism instead of print statements.

Configuration Changes

- Verify deployment env variables and provider credentials are configured for secure production rollout. (deployment configuration)

Why: This config update closes deployment or secret-management gaps and makes the fix reproducible.

Deployment Readiness

Score: **100**

Safe to deploy: **No**

Blocking issues:

- Latest deployment run is blocked or failed

Deployment Strategy

Selected platform: **fly**

Why chosen: Platform selected using deployment fit, security context, and cost model.

Actual provider: **fly**

Detailed Remediation Steps

Step 1 [INFO] - info

Location: snippet.py:1

Action: Use a secure logging mechanism instead of print statements.
